

Bollard Pull Testing.

GMC Produkt AS has for more than 10 years performed Bollard Pull Testing. We execute these tests on a regular basis up to 700 Ton for Norwegian and foreign ship-owners and shipyards.

Our equipment is manual and/or radio controlled. We can with this together with 3rd party authorities if required, do all readouts at a safe distance from the load cell/shackle.

Our computer program is designed to show and compare all tests in a variety of different ways, all in accordance with specifications given by the client, or 3rd party.

Included in the test is one Load Cell/Shackle which can come with radio system, receiver, PC and printer.

We base this on the fact that client has a suitable wire-rope from the ship for the test.

3rd party witnessing of the test can be done by DnV, ABS, Lloyds or other.

Harbor Authorities demands a guard ship to prevent any unwanted accidents during the test. We can arrange this.

We can also supply Wire-rope, shackles and any other kind of couplings for the test. We store Wire-rope up to 90mm, and lengths up 2500meter. Our workshop is equipped with Talurit presses up to 2000 ton.

We have qualified personnel to perform socket molding, control of wire-rope, and all kinds of end connections.

We are equipped with 5 ea wire-spooling machines from 10ton, up to 200 ton, and back tension up to 40tonne at 2 meter.
